

You can link to other pages using the following hyperlink tags:

`` - links to a page in the same folder
`` - links to another website

If you have placed pages in folders within your website, you will need to use these attributes:

`` - links to the page "paul.htm" in a folder named "friends"
`` - links from the page "paul.htm" back to the homepage

You can also link to another place **in the same page** using these tags:

`` - sets a target called "Info" in the page
`` - links to the target called "Info"

You may also want a hyperlink that will allow people to send an email to you.

`` - opens an email addressed to jo@mail.com

Task 1

- a. Create and save a page called "HomePage.htm".
- b. Open a second page. Save as "SecondPage.htm". Type the following code between the body tags:

```
<a href="homepage.htm">1. Click here to visit our homepage</a>
<p><a href="mailto:me@mail.com">2. Click here to send me an email</a></p>
<p><a href="#Bottom">3. Click here to go to the bottom of this page</a></p>
<table height="800">
  <tr>
    <td>Spacing table only</td>
  </tr>
</table>
<p><a name="Bottom">Bottom of this page</a></p>
```

- c. View the page in your browser. Scroll down the page so you are aware of its content.
- d. Click on each link and write down what happens.
 - i. _____
 - ii. _____
 - iii. _____

Task 2

- a. Create a new folder within your website. Create a new page and save it inside the folder. Name the new page "FolderPage.htm"
- b. Create a link from "HomePage.htm" to "FolderPage.htm" (use the tags shown at the top of this page). Test the link in your browser.
- c. Create a link from "FolderPage.htm" back to "HomePage.htm". Test the link in your browser.
